Dyslexia and Music

Presented by Glynis Lavington

‘Practically There!’ Conference
University of Southampton
12th May 2007

Independent Dyslexia Services™

Overview

- Contemporary musicians
- The language of music
- Specific difficulties
- What to look for as an assessor
- Case studies
- Strategies to help/compensations

Contemporary Musicians

- Have often taught themselves to play by ear
- Are not as likely to have had formal lessons using the written language of music
- Have often failed in academic subjects
- May be highly compensated when using their first language
- Includes production of music using a computer e.g. often student cannot play an instrument

The Language of Music

- ‘Notation’ relates to the symbols written down to represent the notes & directions. It is a code just as the alphabet is used as a code.
- The notes on the stave are symbols which are used to represent the sounds
- Processing these symbols can cause confusion for the dyslexic musician

Reading music

- Symbols used to represent the notes are very small and similar in shape & configuration
- The musician needs to remember the names of these notes & the names of the lines & spaces on the stave
- Alphabetical names for notes do not correspond to the alphabetic sequence H does not come after G

Examples of potential problems

1

Additional ledger lines

2

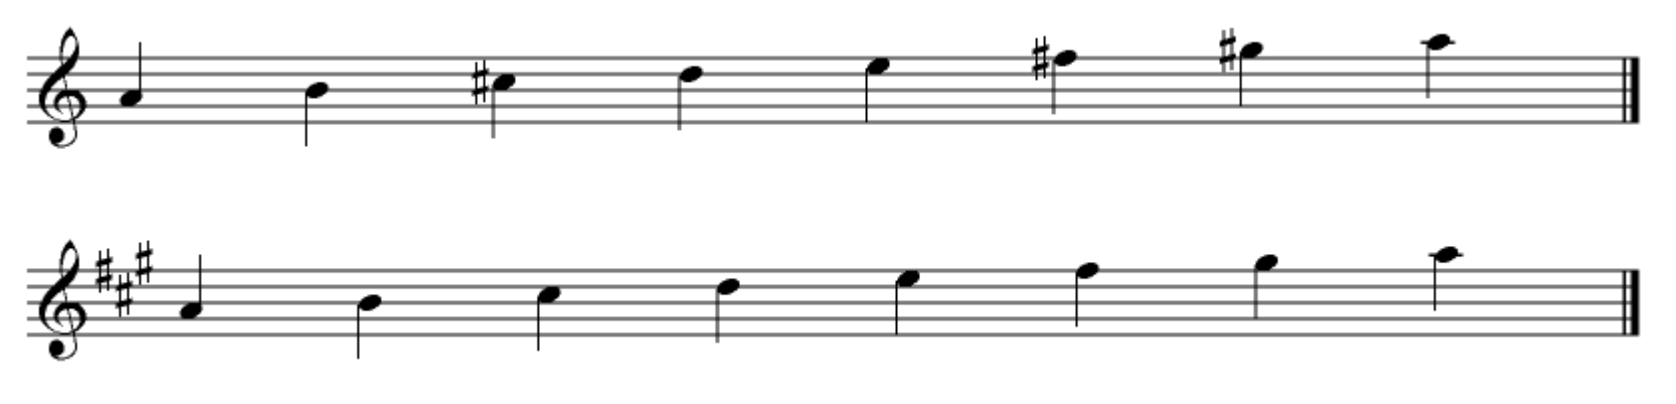
Chords in particular triads – remembering the names
Identifying the root note, 3rd and 5th above it, which scale?
Roman numerals cause additional problems

Time signatures, key signatures, clefs

- Reading the time signature, which looks like a fraction. Which number goes at the top? Which number at the bottom?
- Key signature, tells the musician what key e.g. if it is in G major every ‘F’ note he meets will be F# not F natural
- Treble or bass, both notated on the same lines of the stave but the notes have different letter names

3

4



Use of key signatures – without = individual notes marked
With = student needs to remember key signature from
Beginning of piece

5

Accidentals = can cause further confusion

Names the notes to be played and as such overrides the key
Then reverts back to the key signature which was?

What problems does a dyslexic musician have?

- It feels like sight reading every time I look at it
- I look at a note and then I play the wrong one
- The lines blur and move
- I loose my place
- I lost count
- I sometimes play a line of music with my right hand and it should have been my left!

Piano

Writing notation

- Students with handwriting difficulties have problems with notation
- The symbols need to be placed in the correct place on the stave
- Some rests are very difficult to notate by hand
- The stems can go up or down, on left or right, exceptions e.g. single quaver

Aural perception

The musician listens to a tune and then writes down the correct notes & needs to;

- Remember the sound – to recall the name of the note
- Remember the name of the note – to recall the shape to write
- Remember the sequence
- ALL BEFORE the next bar is played! And they run out of time

Vocalists

- Have to read the notation and lyrics simultaneously
- Are often asked to sing lyrics by singing the vowels only - the artificial separation of syllables
- Have to learn yet another alphabet, Doe,far,so,la,te,doe etc

What causes these difficulties?

- Lack of automaticity
- Speed of processing
- Memorisational problems
- Sequencing difficulties
- Visual perceptual difficulties
- Distractibility
- Loss of concentration
- Fear

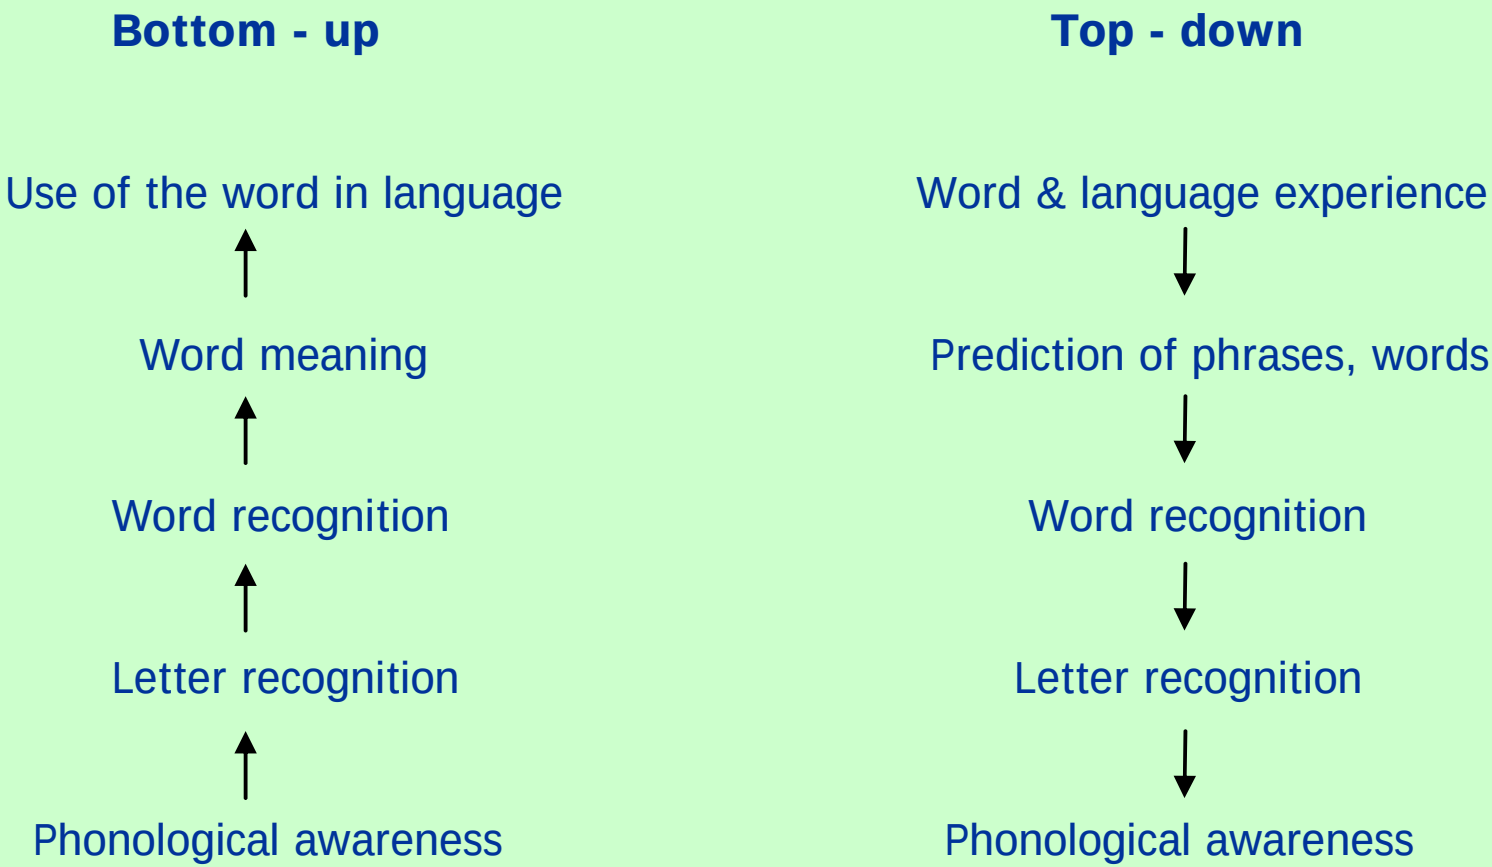
The reading process

- Both language & music have syntax
- Two principle models of the reading process

  Bottom – up processing

  Top – down processing

Bottom – up and Top – down models



Environmental & social economic factors

- Learning environment
- Previous education
- Knowledge of the sounds of the language
- Exposure to the sounds of the language at an early age

Secondary characteristics

- Organisational difficulties
- Lack of confidence
- Low self esteem
- Fear

What to look for?

- Ask questions relating to the language of music e.g. tell me what happens when you are reading music
- What happens when you are writing music score?
- Be careful about asking about sight reading – nearly everyone has difficulties with this

What to look for as an assessor

- Information from the student that indicates they have a difficulty within the context of their course e.g. music
- Evidence within the students profile that supports what the student has told you
- Individual scores of the sub tests will inform which cognitive functions are weak
- If the verbal ability is weak look for additional information from phonological processing tests

What tests are helpful?

- Verbal analogies/similarities
- Vocabulary
- Digit span
- Visual/matrix reasoning
- Coding/SDMT
- CTOPP

Verbal Analogies/Similarities

- Measures verbal abstract reasoning
- Requires – concept of likeness and difference
- Possible difficulties – making analogies, linking information together, seeing the big picture ‘overview’
- In this context – starting in the middle of a piece, linking information, concept that the same chord on a guitar can be played in various ways

Vocabulary

- Measures word meaning and receptive language
- Requires – verbal fluency
- Possible difficulties – ability to verbalise knowledge, auditory memory (especially under a time constraint)
- In this context – lack of fluency when reading score, difficulties with aural perception

Digit Span

- Measures – ability to hold and manipulate auditory information
- Requires – immediate auditory memory, sequential memory, visualisation ability
- Possible difficulties in this context – retaining a pattern of sounds in correct order, retaining instructions and following the order of orally presented lesson, copying from the board

Visual – Matrix reasoning

- Measures visual analysis and sequencing skills
- Requires – perception of part to whole in logical sequencing, noting of details
- Possible difficulties in this context – following a sequence of instructions in a diagrammatic form, breaking the whole piece into component parts

Coding / SDMT

- Measures – ability to discriminate, recall and learn associations between abstract symbols, short-term visual memory, fine motor skills, eye hand co-ordination
- Possible difficulties – fixation ability to keep one's place in music score, slow processing speed & fluency, copying from board, speed of writing

CTOPP

- Measures – phonological awareness and memory, rapid naming
- Alternate tests very useful when student is compensating – significantly lower scores indicate that student will have comprehension difficulties in this context
- Possible difficulties – rapid naming = difficulties with aural perception under a time constraint

Strategies to help

- Multi-sensory
- Holistic
- Mnemonics
- Coloured overlays or music score
- Highlighter pens
- One to one training to learn strategies to help learn music theory
- Metacognition

Compensations

- Enabling technology
- Software e.g. Sibelius/ Logic Pro 7/ Auralia / G7
- Familiarisation and training – software specific
- Means of recording the lecture – and training in how to do so

Examinations

- If the student profile indicates it is necessary consider if they need special provision e.g. sight reading & aural perception exams
- Extra time? Separate room? Consideration to minimise auditory distractions?
